week's discussion, pick a large US corporation, and think of one factor besides a debt tax shield that might be worth including in an APV model when valuing projects by this firm.

Adjusted Present Value Factors - Ace Star Tutors

Adjusted present value is a valuation method which segregates the impact of financing cash flows such as debt tax shield on a project's net present value by discounting non-financing cash flows and financing cash flow separately. The principal difference between equity and debt lies in their tax treatment. Tax laws allow deduction of interest expense in computation of taxable income, but no such advantage is granted in case of dividends paid to common stockholders.
