Surds Definition. Surds are the square roots ($\sqrt{\quad}$) of numbers which cannot be simplified into a whole or rational number. It cannot be accurately represented in a fraction. In other words, a surd is a root of the whole number that has an irrational value. Consider an example, $\sqrt{2} \approx 1.414213$. It is more accurate if we leave it as a surd $\sqrt{2}$.

When his (and other) works were translated into Latin during the 12th century, the word surdus (deaf, mute, dumb) was used. It is interesting that this Latin word, surd, is still used in phonetics today for unvoiced consonants such as p, k, s and t (where the vocal chords are not used).

Roots, Radicals and Surds | Crystal Clear Mathematics

When we can't simplify a number to remove a square root (or cube root etc) then it is a surd. Example: $\sqrt{2}$ (square root of 2) can't be simplified further so it is a surd Example: $\sqrt{4}$ (square root of 4) can be simplified (to 2), so it is not a surd !

Surds - MATH

Surds are numbers left in 'square root form' (or 'cube root form' etc). They are therefore irrational numbers. The reason we leave them as surds is because in decimal form they would go on forever and so this is a very clumsy way of writing them. The video below explains that surds are the roots of numbers that are not whole numbers.

Surds - Mathematics GCSE Revision

Surds are numbers left in square root form that are used when detailed accuracy is required in a calculation. They are numbers which, when written in decimal form, would go on forever.

Surds are irrational numbers that cannot be simplified further to remove 'n' root. When we try to remove the root of any number and it keeps on repeating number and the value goes on and on, these numbers are called Surds .

In many surd simplification problems such double square root surds appear. Unless we free up the surd expression from the surrounding square root there is no way we can proceed further. The obvious and simple way to do this is, To express the two term surd expression under square root as a square of another two-term surd expression.

Surds - simplifying and manipulating roots - StudyWell Surds are essentially square roots of numbers that are not square. For example, 16 is a square number, if you root it you get 4. 8 is not a square number, if you root it you get. This is an example of a surd.

An unresolved root, especially one using the radical symbol, is sometimes referred to as a surd or a radical. Any expression containing a radical, whether it is a square root, a cube root, or a higher root, is called a radical expression , and if it contains no transcendental functions or transcendental numbers it is called an algebraic expression .

nth root - Wikipedia

If a is rational number and n is a positive integer such that the n th root of a is an irrational number, then a 1/n is called a surd or radical. Example: $\sqrt{2}$, $\sqrt{3}$, $\sqrt{5}$ etc. If is a surd then 'n' is known as order of surd and 'a' is known as radicand. Every surd is an irrational number but every irrational number is not a surd.
